

## EL PROYECTO MATRIZ E. COLI SUPERBUG

<http://elproyectomatriz.wordpress.com/2011/06/17/superbacteria-e-coli/>

**“Of forensic evidence shows that the European E.coli superbug was created through bioengineering to produce human casualties.”**

**NATURAL NEWS**

**AUTHOR**

Mike Adams is editor of [Natural News](http://NaturalNews.com), a network of public education websites, non-profit organization that addresses issues that allow people to make positive changes in their health, environmental sensitivity and its habits.

Artículo publicado en [Natural News](#), 06/06/2011.

Although the game of finding the culprit has begun in the European Union, the superbug E.coli victims still adding and filling hospitals in Germany. **In the mass media**, no one seems interested in how bacteria could **become resistant to eight different kinds of antibiotics** by magic, **suddenly appear in addition to food**.

This particular variation is part of E. coli bacteria O104 group, **which normally are not resistant to antibiotics**. For bacteria to acquire such resistance must be repeatedly exposed to antibiotics, in order to create the conditions necessary to acquire complete immunity to them.

Therefore, if someone wanted to trace the origins of the bacteria, so you should do is reverse engineer the genetic code of E.coli, and determine to which antibiotics were exposed during development.

This step has already been done and to observe the genetic decoding of the O104 group that now endangers consumers across the EU, there emerges a fascinating portrait of how it came into existence.

## THE GENETIC CODE REVEALING THE TRUE STORY

**Chinese scientists completed the genome sequence of the new bacterium E. Coli, announced a couple of days ago they discovered genes in bacteria resistant to eight types of antibiotics:**

- [penicilins](#)
- tetracycline
- nalidixic acid
- trimethoprim-sulfamethoxazol
- cephalosporins
- amoxicillin / clavulanic acid
- piperacillin-sulbactam
- piperacillin-tazobactam

**In addition, this O104 strain posses an ability to produce special enzymes that give it what might be called "bacteria superpowers" known technically as [ESBLs \(“Extended-Spectrum Beta-Lactamases”\)](#): enzymes that can be produced by bacteria making them resistant to cephalosporins e.g. cefuroxime, cefotaxime and ceftazidime - which are the most widely used antibiotics in many hospitals**

On top of that, this O104 strain possesses two genes -- TEM-1 and CTX-M-15 -- that "have been making doctors shudder since the 1990s," reports [The Guardian](#). Why do they make doctors shudder? Because they're so deadly that many people infected with such bacteria experience **critical organ failure** and simply die.

## BIOENGINEERING A DEADLY SUPERBUG

So how, exactly, does a bacterial strain come into existence that's resistant to over a dozen antibiotics in eight different drug classes and features two deadly gene mutations plus ESBL enzyme capabilities?

So how, exactly, does a bacterial strain come into existence that's resistant to over a dozen antibiotics in eight different drug classes and features two deadly gene mutations plus ESBL enzyme capabilities? Usually this isn't done at the same time, of course

You first expose it to penicillin and find the surviving colonies which are resistant to penicillin. You then take those surviving colonies and expose them to tetracycline. The surviving colonies are now resistant to both penicillin and tetracycline. You then expose them to a sulfa drug and collect the surviving colonies from that, and so on.

It is a process of genetic selection done in a laboratory with a desired outcome. This is essentially how some bioweapons are engineered by the U.S. Army in its laboratory facility in Ft. Detrick, Maryland

Although the actual process is more complicated than this, the upshot is that creating a strain of e.coli that's resistant to eight classes of antibiotics **requires repeated, sustained expose to those antibiotics.** It is virtually impossible to imagine how this could happen all by itself in the natural world. For example, if this bacteria originated in the food (as we've been told), then where did it acquire all this antibiotic resistance given the fact that antibiotics are not used in vegetables?

When considering the genetic evidence that now confronts us, it is difficult to imagine how this could happen "in the wild.

While resistance to a single antibiotic is common, the creation of a strain of e.coli that's resistant to eight different classes of antibiotics -- in combination -- simply defies the laws of genetic permutation and combination in the wild.

Simply put, this superbug **e.coli strain could not have been created in the wild**. And that leaves only one explanation for where it really came from: **the lab**.

## ENGINEERED AND THEN RELEASE INTO THE WILD

The evidence now points to this deadly strain of e.coli being engineered and then either being released into the food supply or somehow escaping from a lab and entering the food supply inadvertently.

If you disagree with that conclusion -- and you're certainly welcome to -- then you are forced to conclude that this octobiotic superbug (immune to eight classes of antibiotics) developed randomly on its own...and that conclusion is far scarier than the "bioengineered" explanation because it means octobiotic superbugs can simply appear anywhere at any time without cause. That would be quite an exotic theory indeed.

My conclusion actually makes more sense: This strain of e.coli was almost certainly engineered and then released into the food supply for a specific purpose. What would that purpose be? It's obvious, I hope.

It's all **PROBLEM – REACTION - SOLUTION** at work here. First, posing a problem (a deadly strain of E. coli in food). Then wait for the public **REACTION** (huge outcry as the population is terrorized by e.coli). In response to that, enact your desired **SOLUTION** (total control over the global food supply and the outlawing of raw sprouts, raw milk and raw vegetables).

That's what this is all about, of course. The FDA relied on the same phenomenon in the USA when pushing for its recent "[Food Safety Modernization Act](#)" called **THE MONSANTO LAW WHICH ESSENTIALLY OUTLAWES SMALL FAMILY ORGANIC FARMS** unless they lick the boots of FDA regulators.

The FDA was able to crush farm freedom in America by piggybacking on the widespread fear that followed e.coli outbreaks in the U.S. food supply.

**When people are afraid**, remember, it's not difficult to get them to agree to almost **any level of regulatory tyranny**. And making people afraid of their food is a simple matter... a few government press releases emailed to the mainstream media news affiliates is all it takes.

**FIRST BAN THE NATURAL MEDICINE,  
THEN ATTACK THE FOOD SUPPLY**

Now, remember: All this is happening on the heels of the EU **ban on medicinal herbs and nutritional supplements** – a ban that blatantly outlaws nutritional therapies that help keep people healthy and free from disease. **Now that all these herbs and supplements are outlawed, the next step is to make people afraid of fresh food, too.** That's because fresh vegetables are medicinal, and as long as the public has the right to buy fresh vegetables, they can always prevent disease.

But if you can make people AFRAID of fresh vegetables -- or even outlaw them altogether -- then you can force the entire population onto a diet of dead foods and processed foods **THAT PROMOTE DEGENERATIVE**

**DISEASE AND BOLSTER THE PROFITS OF THE POWERFUL DRUG COMPANIES.**

It's all part of the same agenda, you see: **Keep people sick, deny them access to healing herbs and supplements**, then profit from their suffering at the hands of the global drug cartels.

GMOs (Genetically Modified Organism) play a similar role in all this, of course: They're designed to contaminate the food supply with genetic code that causes widespread infertility among human beings. And those who are somehow able to reproduce after exposure to GMOs still suffer from degenerative disease that enriches the drug companies from "treatment."

And those who are somehow able to reproduce after exposure to the GMOs are still suffering degenerative diseases that enrich the pharmaceutical companies 'treatment'.

**Do you recall which country was targeted in this recent e.coli scare? Spain.**

**Why Spain? You may recall that leaked cables from Wikileaks revealed that Spain resisted the introduction of GMOs into its agricultural system, even as [the U.S. government covertly threatened political retaliation for its resistance.](#)**

**That's the real story lies behind the economic devastation of the vegetable farmers in Spain. One of the objectives pursued.**

**FOOD AS WEAPONS OF WAR – CREATED BY BIG PHARMA?**

The most likely explanation of where this strain of e.coli was bioengineered is that the drug giants came up with it in their own labs. Who else has access to all the antibiotics and equipment needed to manage the targeted mutations of potentially thousands of e.coli colonies? **The drug companies are uniquely positioned to both carry out this plot and profit from it.** In other words, they have the means and the motive to engage in precisely such actions.

Aside from the drug companies, perhaps only the infectious disease regulators themselves have this kind of laboratory capacity. The CDC, for example, could probably pull this off if they really wanted to.

The proof that somebody bioengineered this e.coli strain is written right in the DNA of the bacteria. That's forensic evidence, and what it reveals cannot be denied.

This strain underwent repeated and prolonged exposure to eight different classes of antibiotics, and then it somehow managed to appear in the food supply.

How do you get to that if not through a well-planned scheme carried out by rogue scientists?

**There is no such thing as "spontaneous mutation"** into a strain that is resistant to the top eight classes of brand-name antibiotic drugs being sold by Big Pharma today. Such mutations have to be deliberate.

If you disagree with this assessment, then what we are saying is that it was done deliberately ... it was an accident!. Then I say it is even more frightening. Because that means that contamination with antibiotics at a level so exaggeratedly end that a strain of E. Coli in nature can be saturated with eight different kinds of antibiotics to the point to develop naturally in a deadly superbug.If that's what people think is almost more frightening theory that the explanation of bioengineering!

## A NEW ERA HAS BEGUN: BIOLOGICAL WEAPONS ON YOUR

**But in either case -- no matter what you believe -- the simple truth is that the world is now facing a new era of global superbug strains of bacteria that can't be treated with any known pharmaceutical.**

**They can all, of course, be readily killed with **colloidal silver**, which is exactly why the FDA (Administración de Alimentos y Drogas) and world health regulators have viciously attacked colloidal silver companies all these years: They can't have the public getting its hands on natural antibiotics that really work, you see. That would defeat the whole purpose of making everybody sick in the first place.**

**In fact, these strains of e.coli superbugs can be quite readily treated with a combination of natural full-spectrum antibiotics from plants such as garlic, ginger, onions and medicinal herbs.**

**On top of that, probiotics can help balance the flora of the digestive tract and "crowd out" the deadly e.coli that might happen by**  
**Learn more: A healthy immune system and well-functioning digestive tract can fight off an e.coli superbug infection, but that's yet another fact the medical community doesn't want you to know.**

**They much prefer you to remain a helpless victim lying in the hospital, waiting to die, with no options available to you.**

**That's "modern medicine" for ya. They cause the problems that they claim to treat, and then they won't even treat you with anything that works in the first place.**

**Nearly all the deaths now attributable to this e.coli outbreak are easily and readily avoidable. These are deaths of ignorance. But even more, they may also be deaths from a new era of food-based bioweapons unleashed by either a group of mad scientists or an agenda-driven institution that has declared war on the human population.**

## ADDITIONAL DEVELOPMENTS ON THIS E.COLI OUTBREAK

- 22 fatalities have so far been reported, with 2,153 people now sickened and possibly facing kidney failure.
- An agricultural ministry in Germany said that even though they now know the source of the outbreak is a German sprout farm, they are still not lifting their warnings for people to avoid eating tomatoes and lettuce. In other words, keep the people afraid!
- La variante alemana de E. coli, conocida como O104, es un híbrido de las cepas que pueden causar diarrea con sangre y daño renal llamado [“síndrome urémico hemolítico”](#).
- A total of ten European nations have reported outbreaks of this e.coli strain, mostly from people who had visited northern
- The following story is in German, and it hints that [the e.coli outbreak might have been a terrorist attack](#). Yeah, a terrorist attack by the drug companies upon innocent people, as usual...
